

The Misery of **MAINTENANCE**

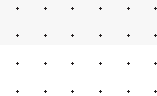

Escape Automation Pains

Why does upgrading and maintaining some automation systems – the basics needed to keep your day-to-day processes operating – cause so much disruption, stress and pain?

In many automation tools, you're responsible for its full technology stack, from networking through to the automation data and client applications. Everything from storage, servers and operating systems to configuration, operation and upgrades. That responsibility includes the core automation servers and every single interconnected automation "agent" on other servers throughout your enterprise.

But all that additional work to maintain your automation system adds **risk** and **downtime**, and doesn't deliver value to your business.

01

It's a time-consuming distraction and disruption from the important things that do **add value**: developing and streamlining automated processes that support your business and your customers.

02

A single update to the automation tool can require a chain of other updates to support it, such as patches to the OS, database drivers, and middleware like Java environments. When that happens, the effort, risk and downtime from the update increase.

03

You may be faced with a “devil’s choice” when an important security patch is released for the OS or middleware and you discover that it isn’t compatible with or isn’t supported by the automation tool. Whether you leave the vulnerability un-patched or apply the patch and risk the disruption – either way – you lose.

**Automation
doesn't need
to be done
this way
anymore.**

01

Redwood's RunMyJobs® SaaS based workload automation takes all the effort, time, risk and costs for operating, updating and maintaining your automation system off your shoulders.

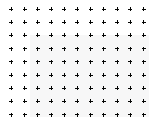

02

You don't need dedicated infrastructure to for your automation system, so there are no costs or effort to buy, license or maintain hardware, OS, databases or middleware.

Users don't need to install anything to access and use the system. Everything is accessed securely through a web browser.

03

Updates are completely automated across your entire enterprise – including every agent – and complete in minutes, not hours or days.

05

Redwood manages and ensures compatibility and security for entire technology stack, so you'll never face the "devil's choice."
